

TruckLog: test guide

App: <https://trucklog-web.vercel.app> · allow about 40 minutes.

This guide lists what to enter, what you should see, and why each part matters to the person using it: a truck driver or dispatcher planning a trip.

1. Who uses it and what it solves

A truck driver in the US may only drive and work a limited number of hours (the FMCSA *Hours of Service* rules). Before each trip, the driver or dispatcher has to answer:

- Can this trip be done legally, and when will the truck arrive?
- Where must the driver stop for fuel, breaks and sleep?
- What will the driver's daily log sheet look like for each day?

Today this is worked out by hand with a calculator and a paper log. TruckLog does it in a few seconds and fills in the log sheets.

2. What you enter

Trip (required)

Field	What it means	Example	Why the app needs it
Current location	Where the truck is right now	Chicago, IL	Start of the route; its time zone becomes the home-terminal time on the logs
Pickup	Where the load is picked up	St. Louis, MO	Adds 1 hour of on-duty time (loading)
Dropoff	Where the load is delivered	Dallas, TX	Adds 1 hour of on-duty time (unloading)
Cycle hours used	Hours the driver has already worked in the last 8 days (0–70)	12.5	The law allows 70 hours in 8 days. This sets how much time is left before a 34-hour restart is forced.
Departure	When the trip starts, in local time at the truck	today 06:00	Places every stop at real clock times and splits the logs into calendar days

Type a place and pick a suggestion, or type the full city and state and submit; the server looks it up.

Log sheet details (optional)

In the form under **Log sheet details** → **Add**, or later above the sheets under **Sheet details**.

Field	Example	Printed on the sheet at
Driver name	Jai Surya	Bottom right, "Driver's name"
Carrier name	Northline Transport	Top right, "Name of Carrier or Carriers"
Main office address	2200 W Lake St, Chicago, IL	Top right, "Main Office Address"
Home terminal address	Chicago, IL	Top right, "Home Terminal Address"
Truck / trailer numbers	T-418 / TR-2207	Top left, under the mileage boxes
Manifest or BOL number	BOL-55120	Bottom left, "DVL or Manifest No."
Shipper and commodity	Acme Foods, packaged goods	Bottom left, "Shipper & Commodity"

Fields left empty print as blank lines, like the paper form.

3. Test cases

The expected values below were measured on the live app. Miles can move by a few miles depending on the exact spot the map picks for a city. Clock times depend on the departure you choose; use **06:00** to match the tables.

Test 1: Short trip, one day

Enter	
Current / Pickup / Dropoff	Dallas, TX / Fort Worth, TX / Austin, TX
Cycle hours used	0

Expect

- About **221 mi, 6h 15m driving, 8h 15m on duty, 1 day**.
- "No rests needed". The itinerary shows drive → pickup → drive → dropoff only.
- One log sheet totalling **24 h**.

Why it matters: for a short run, the driver immediately sees that no rest is needed, and gets a finished log for the day.

Test 2: Multi-day trip (the main case)

Enter	
Current / Pickup / Dropoff	Chicago, IL / St. Louis, MO / Dallas, TX
Cycle hours used	12.5
Departure	a future date, 06:00

Expect: summary

- About **964–971 mi, 22h 30m driving, 3 days, 1 break, 2 rests**.

Expect: itinerary

- Drive about 301 mi to St. Louis, then pickup (1 h on duty).
- Driving stops after 11 h in total, then a **10–hr sleeper–berth rest**.
- The next day, a **30–minute break** after 8 h of driving.
- Dropoff in Dallas (1 h on duty).

Expect: Day 1 log sheet

Row	Hours
Off duty	6
Sleeper berth	6
Driving	11
On duty (not driving)	1
Total	24

- Miles driven today: about **464**. From: Chicago, IL. To: the city where the rest is.
- Recap: **12** on duty today, **24.5** total in the cycle, **45.5** available tomorrow.
- Remarks: a slanted city name at every change of status (Chicago, St. Louis pickup, the rest stop).

Why it matters: the driver gets a legal schedule with the arrival time, knows where they'll sleep, and has log sheets ready to carry. Planning this by hand takes much longer and is easy to get wrong.

Test 3: Driver almost out of hours (forced 34–hour restart)

Enter	
Current / Pickup / Dropoff	Atlanta, GA / Nashville, TN / Denver, CO
Cycle hours used	62

Expect

- About **1,401 mi, 33h 30m driving, 5 days**.
- Stops: **1 fuel stop, 1 break, 2 rests, 1 restart**.
- An orange notice: "The 70–hr cycle runs out mid-trip, so the plan includes a 34–hr restart".
- The itinerary shows a **34–hr restart** shortly after the pickup.
- One day is almost entirely **Off duty**. Its sheet has a remark at midnight explaining the restart.
- On the day the restart ends, "available tomorrow" goes back up.

Why it matters: this is the case people most often get wrong by hand. The app shows the driver *before* dispatch that the load arrives days later than a naive estimate, so the dispatcher can reassign the load or reset expectations with the customer.

Test 4: Long haul with fuel stops

Enter	
Current / Pickup / Dropoff	New York, NY / Chicago, IL / Los Angeles, CA
Cycle hours used	30

Expect

- About **2,810 mi, 65h 15m driving, 7 days**.
- **2 fuel stops**, each before 1,000 miles since the last one, and 30 min on duty.
- 3 breaks, 5 rests, 1 restart.
- Seven log sheets, each totalling 24 h.

Why it matters: long-haul planning (fuel, sleep and the weekly cycle together) is where the tool saves the most time.

Test 5: Sheet details

1. Plan Test 2, open the **Daily logs** tab and expand **Sheet details**.
2. Enter a driver name, carrier, truck/trailer numbers and a BOL number.

Expect

- Each value appears on the sheet as you type, in the right box (see section 2), on **every** day's sheet.
- Fields you left empty stay as blank lines.
- Reload the page and plan a new trip.

Expect

- The driver, carrier, offices and truck are still filled in; the BOL and shipper are empty again.

Why it matters: the sheets are ready to sign and hand over, not a mock-up. The driver sets carrier, truck and name once, not on every trip, and enters shipping details per load, as in real life.

Test 6: Print and share

1. On the Daily logs tab, click **Print logs**.

Expect: landscape pages, **one sheet per page**, with no website header, form or map. The page count equals the number of days, and "Save as PDF" works.

1. Click **Share link**, then open the link in a new window.

Expect: the same trip is planned again with the same sheet details.

Why it matters: drivers must keep 8 days of logs, and dispatchers work with others. A PDF or a link is how the plan leaves the app.

Test 7: Mistakes and bad input

Do this	Expect
Plan with all fields empty	Messages under each field, e.g. "Enter where the truck is now." Nothing is sent.
Cycle hours used = 71	"Enter a number from 0 to 70."
Dropoff = asdfghjkl	"We couldn't find 'asdfghjkl'. Try a city and state." and a Try again link
Dropoff = London (the UK one)	A clear message that no drivable route connects the places
Click Edit trip after planning	The form returns with everything filled in

Why it matters: a user who makes a typo is told exactly what to fix, and never loses what they already typed.

4. Checks that prove the logs are correct

For every trip you plan, confirm:

- ☐ Each sheet's four totals add up to exactly **24**.
- ☐ The duty line on the grid matches the itinerary times.
- ☐ No more than **11 h** of driving without a 10-h rest in between.
- ☐ A **30-min** break (or a 30-min+ stop) appears before driving goes past 8 h.
- ☐ No driving after **14 h** from the start of the duty day.
- ☐ A **fuel stop** at least every 1,000 miles.
- ☐ Pickup and dropoff each show **1 h** on duty.
- ☐ When cycle hours would pass 70, there is a **34-h restart**.

Note: one calendar day can show more than 11 h of driving when it spans two duty periods with a 10-hour rest between them. That's legal, and the app explains it on that sheet.

5. Screen sizes

- **Phone (about 390 px):** in the browser's device toolbar, the form stacks in one column with no sideways scrolling. The log sheet scrolls sideways inside its frame.
- **Desktop (1440 px):** the form and rules sit side by side; the map sits next to the itinerary.

6. Reporting a problem

Note the steps, the URL (it holds the whole trip), what you expected and what you saw. Include any red errors from the browser console (F12 → Console).
